

Typical Use of Springland Bin Unload Equipment

1.

70 – 80% of the grain is removed through the center sump by gravity

2.

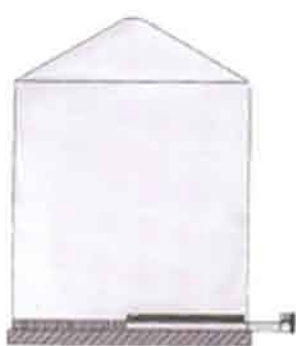

When the center sump runs empty, grain is removed through the intermediate sump(s) to free the sweep.

3.

The sweep removes the remaining 20-30% of the grain.

4.

The sweep is placed above the intermediate sump(s) and the bin is ready to be refilled.
